Table of Contents

The table of contents for this tutorial is as follows -

- Import libraries
- Read dataset
- Exploratory data analysis
- Visualize distribution of Age variable with Seaborn distplot() function
- Seaborn Kernel Density Estimation (KDE) plot
- Histograms
- Visualize distribution of values in Preferred Foot variable with Seaborn countplot() function
- Seaborn catplot() function
- Seaborn stripplot() function
- Seaborn boxplot() function
- Seaborn violinplot() function
- Seaborn pointplot() function
- Seaborn barplot() function
- Visualizing statistical relationship with Seaborn relplot() function
- Seaborn scatterplot() function
- Seaborn lineplot() function
- Seaborn regplot() function
- Seaborn Implot() function
- Multi-plot grids
- Seaborn Facetgrid() function

- Seaborn Pairgrid() function
- Seaborn Jointgrid() function
- Controlling the size and shape of the plot
- Seaborn figure styles

Import libraries¶

```
In [1]: # This Python 3 environment comes with many helpful analytics libraries installed  
# It is defined by the kaggle/python docker image: https://github.com/kaggle/doc  
# For example, here's several helpful packages to load in
```

```
import numpy as np # linear algebra  
import pandas as pd # data processing, CSV file I/O (e.g. pd.read_csv)  
import seaborn as sns  
sns.set(style="whitegrid")  
import matplotlib.pyplot as plt  
from collections import Counter  
%matplotlib inline  
  
# Input data files are available in the "../input/" directory.  
# For example, running this (by clicking run or pressing Shift+Enter) will list  
  
import os  
for dirname, _, filenames in os.walk('/kaggle/input'):  
    for filename in filenames:  
        print(os.path.join(dirname, filename))  
  
# Any results you write to the current directory are saved as output.
```

```
In [2]: # ignore warnings  
import warnings  
warnings.filterwarnings('ignore')
```

```
In [7]: fifa19 = pd.read_csv(r'C:\Users\WELCOME\Documents\Data Science\July 2025\25th-mo
```

```
In [8]: fifa19
```

Comment

- This dataset contains 89 variables.
- Out of the 89 variables, 44 are numerical variables. 38 are of float64 data type and remaining 6 are of int64 data type.
- The remaining 45 variables are of character data type.

- Let's explore this further.

Explore Age variable

Visualize distribution of Age variable with Seaborn distplot() function

- Seaborn `distplot()` function flexibly plots a univariate distribution of observations.
- This function combines the matplotlib hist function (with automatic calculation of a good default bin size) with the seaborn `kdeplot()` and `rugplot()` functions.
- - So, let's visualize the distribution of Age variable with Seaborn `distplot()` function.

```
In [12]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
ax = sns.distplot(x, bins=10)
plt.show()
```

Comment

- It can be seen that the Age variable is slightly positively skewed.

We can use Pandas series object to get an informative axis label as follows-

```
In [13]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
x = pd.Series(x, name="Age variable")
ax = sns.distplot(x, bins=10)
plt.show()
```

We can plot the distribution on the vertical axis as follows:-

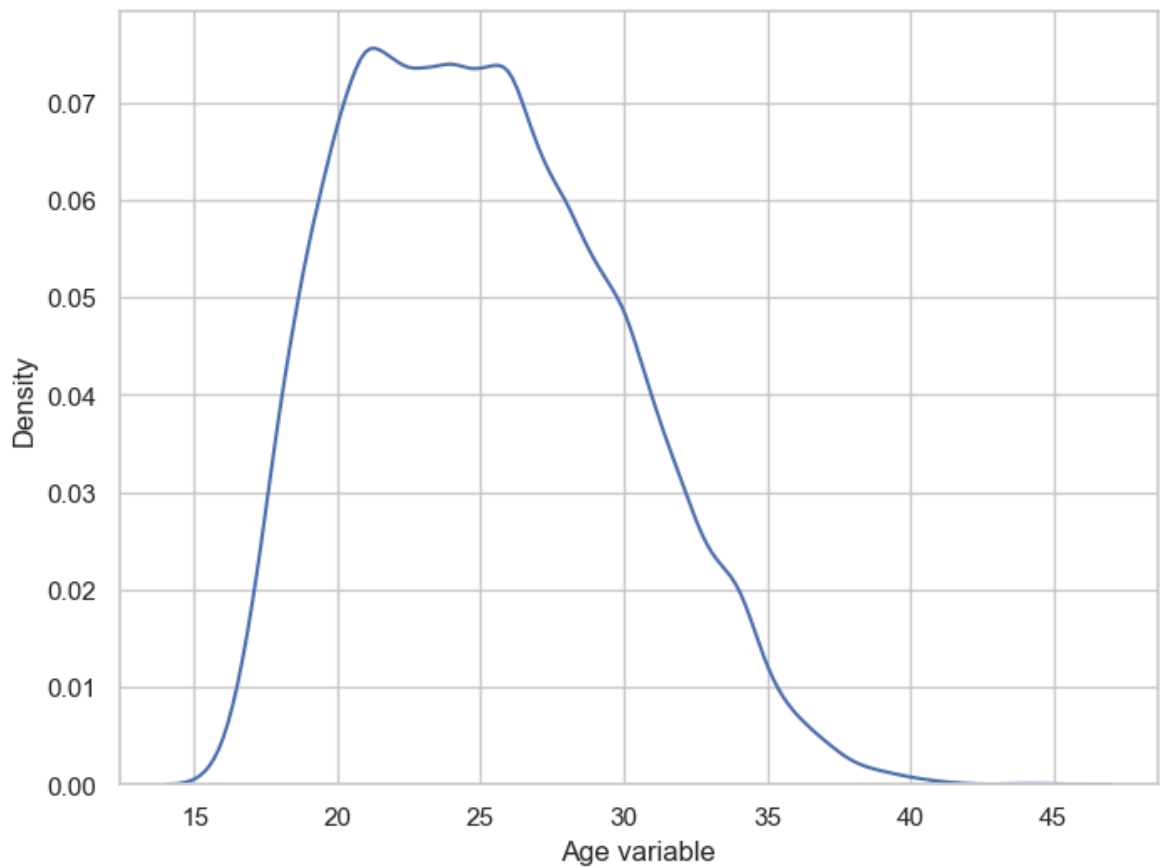

```
In [14]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
ax = sns.distplot(x, bins=10, vertical = True)
plt.show()
```

Seaborn Kernel Density Estimation (KDE) Plot

- The **kernel density estimate (KDE)** plot is a useful tool for plotting the shape of a distribution.
- Seaborn `kdeplot` is another seaborn plotting function that fits and plot a univariate or bivariate kernel density estimate.
- Like the histogram, the KDE plots encode the density of observations on one axis with height along the other axis.
- We can plot a KDE plot as follows-

```
In [15]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
x = pd.Series(x, name="Age variable")
ax = sns.kdeplot(x)
plt.show()
```

We can shade under the density curve and use a different color as follows:-

```
In [16]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
x = pd.Series(x, name="Age variable")
ax = sns.kdeplot(x, shade=True, color='r')
plt.show()
```

Histograms

- A histogram represents the distribution of data by forming bins along the range of the data and then drawing bars to show the number of observations that fall in each bin.
- A `hist()` function already exists in matplotlib.
- We can use Seaborn to plot a histogram.

```
In [17]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
ax = sns.distplot(x, kde=False, rug=True, bins=10)
plt.show()
```

We can plot a KDE plot alternatively as follows:-

```
In [18]: f, ax = plt.subplots(figsize=(8,6))
x = fifa19['Age']
ax = sns.distplot(x, hist=False, rug=True, bins=10)
plt.show()
```

Explore Preferred Foot variable

Check number of unique values in Preferred Foot variable

```
In [19]: fifa19['Preferred Foot'].nunique()
```

```
Out[19]: 2
```

We can see that there are two types of unique values in Preferred Foot variable.

Check frequency distribution of values in Preferred Foot variable

```
In [20]: fifa19['Preferred Foot'].value_counts()
```

```
Out[20]: Preferred Foot
Right    13948
Left     4211
Name: count, dtype: int64
```

The Preferred Foot variable contains two types of values - Right and Left .

Visualize distribution of values with Seaborn countplot() function.

- A countplot shows the counts of observations in each categorical bin using bars.
 - It can be thought of as a histogram across a categorical, instead of quantitative, variable.
 - This function always treats one of the variables as categorical and draws data at ordinal positions (0, 1, ... n) on the relevant axis, even when the data has a numeric or date type.
1. • We can visualize the distribution of values with Seaborn `countplot()` function as follows-

```
In [21]: f, ax = plt.subplots(figsize=(8, 6))
sns.countplot(x="Preferred Foot", data=fifa19, color="c")
plt.show()
```

We can show value counts for two categorical variables as follows-

```
In [22]: f, ax = plt.subplots(figsize=(8, 6))
sns.countplot(x="Preferred Foot", hue="Real Face", data=fifa19)
plt.show()
```

We can draw plot vertically as follows-

```
In [23]: f, ax = plt.subplots(figsize=(8, 6))
sns.countplot(y="Preferred Foot", data=fifa19, color="c")
plt.show()
```

Seaborn `Catplot()` function

- We can use Seaborn `Catplot()` function to plot categorical scatterplots.
- The default representation of the data in `catplot()` uses a scatterplot.
- It helps to draw figure-level interface for drawing categorical plots onto a `facetGrid`.
- This function provides access to several axes-level functions that show the relationship between a numerical and one or more categorical variables using one of several visual representations.
- The `kind` parameter selects the underlying axes-level function to use.

We can use the `kind` parameter to draw different plot kind to visualize the same data. We can use the Seaborn `catplot()` function to draw a `countplot()` as follows-

```
In [24]: g = sns.catplot(x="Preferred Foot", kind="count", palette="ch:.25", data=fifa19)
```

Explore `International Reputation` variable

Check the number of unique values in `International Reputation` variable

```
In [25]: fifa19['International Reputation'].unique()
```

```
Out[25]: 5
```

Check the distribution of values in International Reputation variable

```
In [26]: fifa19['International Reputation'].value_counts() # check
```

```
Out[26]: International Reputation
1.0      16532
2.0       1261
3.0        309
4.0         51
5.0          6
Name: count, dtype: int64
```

Seaborn Stripplot() function

- This function draws a scatterplot where one variable is categorical.
- A strip plot can be drawn on its own, but it is also a good complement to a box or violin plot in cases where we want to show all observations along with some representation of the underlying distribution.
- I will plot a stripplot with International Reputation as categorical variable and Potential as the other variable.

```
In [27]: f, ax = plt.subplots(figsize=(8, 6))
sns.stripplot(x="International Reputation", y="Potential", data=fifa19)
plt.show()
```

We can add jitter to bring out the distribution of values as follows-

```
In [28]: f, ax = plt.subplots(figsize=(8, 6))
sns.stripplot(x="International Reputation", y="Potential", data=fifa19, jitter=True)
plt.show()
```

We can nest the strips within a second categorical variable - Preferred Foot - as follows-

```
In [29]: f, ax = plt.subplots(figsize=(8, 6))
sns.stripplot(x="International Reputation", y="Potential", hue="Preferred Foot",
              data=fifa19, jitter=0.2, palette="Set2", dodge=True)
plt.show()
```

We can draw strips with large points and different aesthetics as follows-

```
In [30]: f, ax = plt.subplots(figsize=(8, 6))
sns.stripplot(x="International Reputation", y="Potential", hue="Preferred Foot",
              data=fifa19, palette="Set2", size=20, marker="D",
              edgecolor="gray", alpha=.25)
plt.show()
```

Seaborn `boxplot()` function

- This function draws a box plot to show distributions with respect to categories.
- A box plot (or box-and-whisker plot) shows the distribution of quantitative data in a way that facilitates comparisons between variables or across levels of a categorical variable.
- The box shows the quartiles of the dataset while the whiskers extend to show the rest of the distribution, except for points that are determined to be "outliers" using a method that is a function of the inter-quartile range.
- I will plot the boxplot of the `Potential` variable as follows-

```
In [31]: f, ax = plt.subplots(figsize=(8, 6))
sns.boxplot(x=fifa19["Potential"])
plt.show()
```

We can draw the vertical boxplot grouped by the categorical variable `International Reputation` as follows-

```
In [32]: f, ax = plt.subplots(figsize=(8, 6))
sns.boxplot(x="International Reputation", y="Potential", data=fifa19)
plt.show()
```

We can draw a boxplot with nested grouping by two categorical variables as follows-

```
In [33]: f, ax = plt.subplots(figsize=(8, 6))
sns.boxplot(x="International Reputation", y="Potential", hue="Preferred Foot", d
plt.show()
```

Seaborn `violinplot()` function

- This function draws a combination of boxplot and kernel density estimate.
- A violin plot plays a similar role as a box and whisker plot.
- It shows the distribution of quantitative data across several levels of one (or more) categorical variables such that those distributions can be compared.
- Unlike a box plot, in which all of the plot components correspond to actual datapoints, the violin plot features a kernel density estimation of the underlying distribution.
- I will plot the violinplot of `Potential` variable as follows-

```
In [34]: f, ax = plt.subplots(figsize=(8, 6))
sns.violinplot(x=fifa19["Potential"])
plt.show()
```

We can draw the vertical violinplot grouped by the categorical variable `International Reputation` as follows-

```
In [35]: f, ax = plt.subplots(figsize=(8, 6))
sns.violinplot(x="International Reputation", y="Potential", data=fifa19)
plt.show()
```

We can draw a violinplot with nested grouping by two categorical variables as follows-

```
In [36]: f, ax = plt.subplots(figsize=(8, 6))
sns.violinplot(x="International Reputation", y="Potential", hue="Preferred Foot")
plt.show()
```

We can draw split violins to compare the across the hue variable as follows-

```
In [37]: f, ax = plt.subplots(figsize=(8, 6))
sns.violinplot(x="International Reputation", y="Potential", hue="Preferred Foot",
               data=fifa19, palette="muted", split=True)
plt.show()
```

Seaborn `pointplot()` function

- This function show point estimates and confidence intervals using scatter plot glyphs.
- A point plot represents an estimate of central tendency for a numeric variable by the position of scatter plot points and provides some indication of the uncertainty around that estimate using error bars.

```
In [38]: f, ax = plt.subplots(figsize=(8, 6))
sns.pointplot(x="International Reputation", y="Potential", data=fifa19)
plt.show()
```

We can draw a set of vertical points with nested grouping by a two variables as follows-

```
In [39]: f, ax = plt.subplots(figsize=(8, 6))
sns.pointplot(x="International Reputation", y="Potential", hue="Preferred Foot",
plt.show())
```

We can separate the points for different hue levels along the categorical axis as follows-

```
In [40]: f, ax = plt.subplots(figsize=(8, 6))
sns.pointplot(x="International Reputation", y="Potential", hue="Preferred Foot",
plt.show())
```

We can use a different marker and line style for the hue levels as follows-

```
In [41]: f, ax = plt.subplots(figsize=(8, 6))
sns.pointplot(x="International Reputation", y="Potential", hue="Preferred Foot",
              data=fifa19, markers=["o", "x"], linestyles=["-", "--"])
plt.show()
```

Seaborn `barplot()` function

- This function shows point estimates and confidence intervals as rectangular bars.
- A bar plot represents an estimate of central tendency for a numeric variable with the height of each rectangle and provides some indication of the uncertainty around that estimate using error bars.
- Bar plots include 0 in the quantitative axis range, and they are a good choice when 0 is a meaningful value for the quantitative variable, and you want to make comparisons against it.
- We can plot a barplot as follows-

```
In [42]: f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", data=fifa19)
plt.show()
```

We can draw a set of vertical bars with nested grouping by a two variables as follows-

```
In [43]: f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", hue="Preferred Foot", d
plt.show()
```

We can use median as the estimate of central tendency as follows-

```
In [44]: from numpy import median
f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", data=fifa19, estimator=
plt.show())
```

We can show the standard error of the mean with the error bars as follows-

```
In [45]: f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", data=fifa19, ci=68)
plt.show()
```

We can show standard deviation of observations instead of a confidence interval as follows-

```
In [46]: f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", data=fifa19, ci="sd")
plt.show()
```

We can add "caps" to the error bars as follows-

```
In [47]: f, ax = plt.subplots(figsize=(8, 6))
sns.barplot(x="International Reputation", y="Potential", data=fifa19, capsize=0.
plt.show()
```

Visualizing statistical relationship with Seaborn `relplot()` function

Seaborn `relplot()` function

- Seaborn `relplot()` function helps us to draw figure-level interface for drawing relational plots onto a FacetGrid.
- This function provides access to several different axes-level functions that show the relationship between two variables with semantic mappings of subsets.
- The `kind` parameter selects the underlying axes-level function to use-
- `scatterplot()` (with `kind="scatter"`; the default)
- `lineplot()` (with `kind="line"`)

we can plot a scatterplot with variables `Height` and `Weight` with Seaborn `relplot()` function as follows-

```
In [48]: g = sns.relplot(x="Overall", y="Potential", data=fifa19)
```

Seaborn `scatterplot()` function

- This function draws a scatter plot with possibility of several semantic groups.
- The relationship between x and y can be shown for different subsets of the data using the `hue`, `size` and `style` parameters.
- These parameters control what visual semantics are used to identify the different subsets.

```
In [49]: f, ax = plt.subplots(figsize=(8, 6))
sns.scatterplot(x="Height", y="Weight", data=fifa19)
plt.show()
```

Seaborn `lineplot()` function

- This function draws a line plot with possibility of several semantic groupings.
- The relationship between x and y can be shown for different subsets of the data using the `hue`, `size` and `style` parameters.
- These parameters control what visual semantics are used to identify the different subsets.

```
In [50]: f, ax = plt.subplots(figsize=(8, 6))
ax = sns.lineplot(x="Stamina", y="Strength", data=fifa19)
plt.show()
```

Visualize linear relationship with Seaborn `regplot()` function

Seaborn `regplot()` function

- This function plots data and a linear regression model fit.
- We can plot a linear regression model between `Overall` and `Potential` variable with `regplot()` function as follows-

```
In [51]: f, ax = plt.subplots(figsize=(8, 6))
ax = sns.regplot(x="Overall", y="Potential", data=fifa19)
plt.show()
```

we can use a different color and marker as follows-

```
In [52]: f, ax = plt.subplots(figsize=(8, 6))
ax = sns.regplot(x="Overall", y="Potential", data=fifa19, color="g", marker="+")
plt.show()
```

We can plot with a discrete variable and add some jitter as follows-

```
In [53]: f, ax = plt.subplots(figsize=(8, 6))
sns.regplot(x="International Reputation", y="Potential", data=fifa19, x_jitter=.
plt.show())
```

Seaborn `lplot()` function

- This function plots data and regression model fits across a `FacetGrid`.
- This function combines `regplot()` and `FacetGrid`.
- It is intended as a convenient interface to fit regression models across conditional subsets of a dataset.
- We can plot a linear regression model between `Overall` and `Potential` variable with `lplot()` function as follows-

```
In [54]: g= sns.lplot(x="Overall", y="Potential", data=fifa19)
```

We can condition on a third variable and plot the levels in different colors as follows-

```
In [55]: g = sns.lmplot(x="Overall", y="Potential", hue="Preferred Foot", data=fifa19)
```

We can use a different color palette as follows-

```
In [56]: g = sns.lmplot(x="Overall", y="Potential", hue="Preferred Foot", data=fifa19, pal
```

We can plot the levels of the third variable across different columns as follows-

```
In [57]: g = sns.lmplot(x="Overall", y="Potential", col="Preferred Foot", data=fifa19)
```

Multi-plot grids

Seaborn `FacetGrid()` function

- The `FacetGrid` class is useful when you want to visualize the distribution of a variable or the relationship between multiple variables separately within subsets of your

dataset.

- A FacetGrid can be drawn with up to three dimensions - `row`, `col` and `hue`. The first two have obvious correspondence with the resulting array of axes - the `hue` variable is a third dimension along a depth axis, where different levels are plotted with different colors.
- The class is used by initializing a FacetGrid object with a dataframe and the names of the variables that will form the `row`, `column` or `hue` dimensions of the grid.
- These variables should be categorical or discrete, and then the data at each level of the variable will be used for a facet along that axis.

In []:

We can initialize a 1x2 grid of facets using the fifa19 dataset.

```
In [58]: g = sns.FacetGrid(fifa19, col="Preferred Foot")
```

We can draw a univariate plot of Potential variable on each facet as follows-

```
In [59]: g = sns.FacetGrid(fifa19, col="Preferred Foot")
g = g.map(plt.hist, "Potential")
```

```
In [60]: g = sns.FacetGrid(fifa19, col="Preferred Foot")
g = g.map(plt.hist, "Potential", bins=10, color="r")
```

We can plot a bivariate function on each facet as follows-

```
In [62]: g = sns.FacetGrid(fifa19, col="Preferred Foot")
g = (g.map(plt.scatter, "Height", "Weight", edgecolor="w").add_legend())
```

The size of the figure is set by providing the height of each facet, along with the aspect ratio:

```
In [63]: g = sns.FacetGrid(fifa19, col="Preferred Foot", height=5, aspect=1)
g = g.map(plt.hist, "Potential")
```

Seaborn Pairgrid() function

- This function plots subplot grid for plotting pairwise relationships in a dataset.
- This class maps each variable in a dataset onto a column and row in a grid of multiple axes.
- Different axes-level plotting functions can be used to draw bivariate plots in the upper and lower triangles, and the the marginal distribution of each variable can be shown on the diagonal.
- It can also represent an additional level of conditionalization with the hue parameter, which plots different subsets of data in different colors.
- This uses color to resolve elements on a third dimension, but only draws subsets on top of each other and will not tailor the hue parameter for the specific visualization the way that axes-level functions that accept hue will.

```
In [64]: fifa19_new = fifa19[['Age', 'Potential', 'Strength', 'Stamina', 'Preferred Foot']]
```

```
In [65]: g = sns.PairGrid(fifa19_new)
g = g.map(plt.scatter)
```

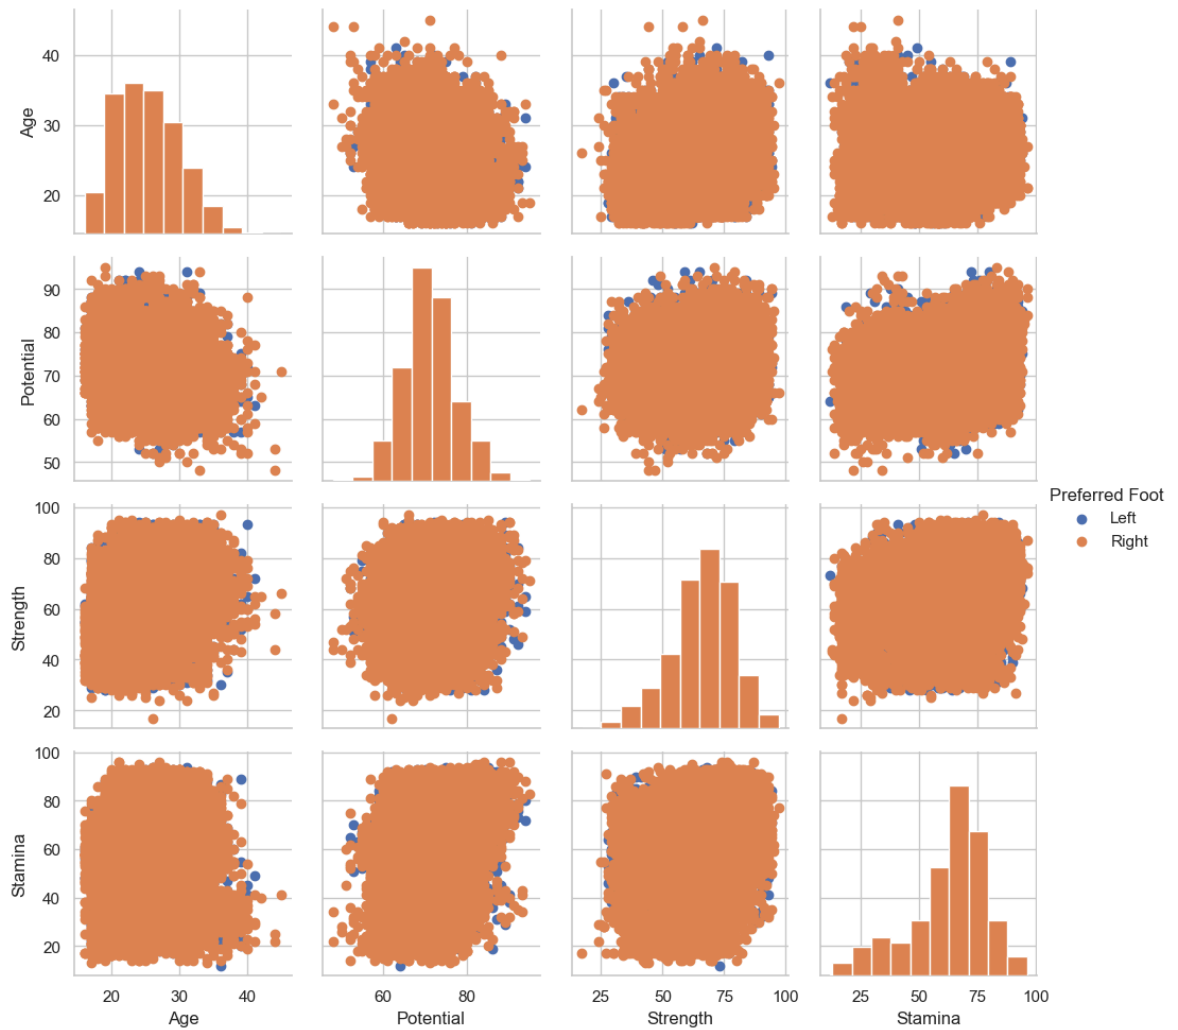

We can show a univariate distribution on the diagonal as follows-

```
In [66]: g = sns.PairGrid(fifa19_new)
g = g.map_diag(plt.hist)
g = g.map_offdiag(plt.scatter)
```

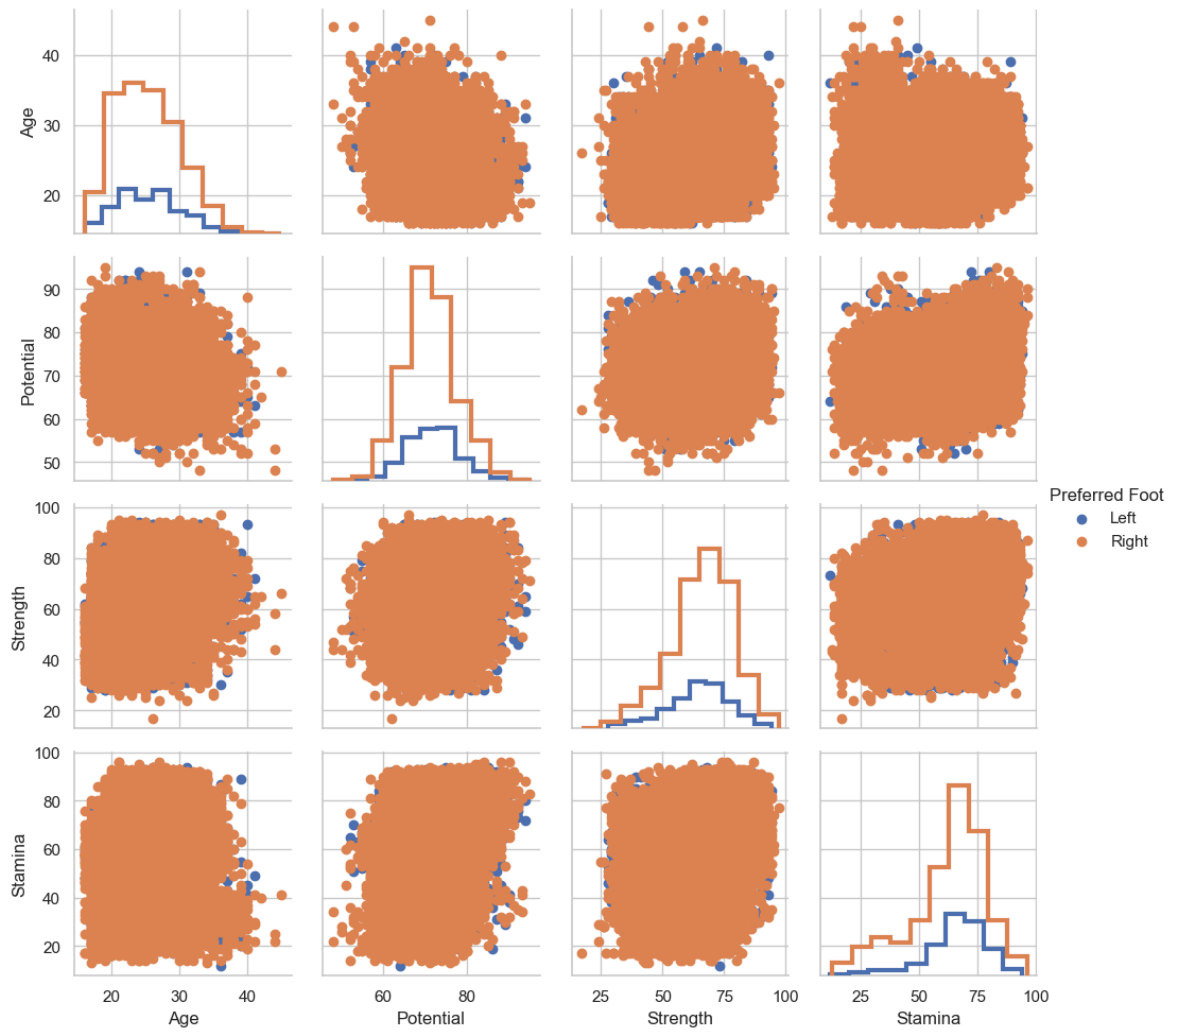

We can color the points using the categorical variable `Preferred Foot` as follows -

```
In [67]: g = sns.PairGrid(fifa19_new, hue="Preferred Foot")
g = g.map_diag(plt.hist)
g = g.map_offdiag(plt.scatter)
g = g.add_legend()
```

We can use a different style to show multiple histograms as follows-

```
In [68]: g = sns.PairGrid(fifa19_new, hue="Preferred Foot")
g = g.map_diag(plt.hist, histtype="step", linewidth=3)
g = g.map_offdiag(plt.scatter)
g = g.add_legend()
```

We can plot a subset of variables as follows-

```
In [69]: g = sns.PairGrid(fifa19_new, vars=['Age', 'Stamina'])
g = g.map(plt.scatter)
```

We can use different functions on the upper and lower triangles as follows-

```
In [70]: g = sns.PairGrid(fifa19_new)
g = g.map_upper(plt.scatter)
g = g.map_lower(sns.kdeplot, cmap="Blues_d")
g = g.map_diag(sns.kdeplot, lw=3, legend=False)
```

Seaborn `Jointgrid()` function

- This function provides a grid for drawing a bivariate plot with marginal univariate plots.
- It set up the grid of subplots.

We can initialize the figure and add plots using default parameters as follows-

In []:

```
In [71]: g = sns.JointGrid(x="Overall", y="Potential", data=fifa19)
g = g.plot(sns.regplot, sns.distplot)
```

We can draw the joint and marginal plots separately, which allows finer-level control other parameters as follows -

```
In [72]: import matplotlib.pyplot as plt
```

```
In [73]: g = sns.JointGrid(x="Overall", y="Potential", data=fifa19)
g = g.plot_joint(plt.scatter, color=".5", edgecolor="white")
g = g.plot_marginals(sns.distplot, kde=False, color=".5")
```

we can remove the space between the joint and marginal axes as follows -

```
In [74]: g = sns.JointGrid(x="Overall", y="Potential", data=fifa19, space=0)
g = g.plot_joint(sns.kdeplot, cmap="Blues_d")
g = g.plot_marginals(sns.kdeplot, shade=True)
```

We can draw a smaller plot with relatively larger marginal axes as follows -

```
In [75]: g = sns.JointGrid(x="Overall", y="Potential", data=fifa19, height=5, ratio=2)
g = g.plot_joint(sns.kdeplot, cmap="Reds_d")
g = g.plot_marginals(sns.kdeplot, color="r", shade=True)
```

Controlling the size and shape of the plot

- The default plots made by `regplot()` and `lmplot()` look the same but on axes that have a different size and shape.
- This is because `regplot()` is an “axes-level” function draws onto a specific axes.
- This means that you can make multi-panel figures yourself and control exactly where the regression plot goes.
- If no axes object is explicitly provided, it simply uses the “currently active” axes, which is why the default plot has the same size and shape as most other matplotlib functions.
- To control the size, we need to create a figure object ourselves as follows-

```
In [76]: f, ax = plt.subplots(figsize=(8, 6))
ax = sns.regplot(x="Overall", y="Potential", data=fifa19);
```

In contrast, the size and shape of the `lmplot()` figure is controlled through the `FacetGrid` interface using the `size` and `aspect` parameters, which apply to each facet in the plot, not to the overall figure itself.

```
In [ ]: sns.lmplot(x="Overall", y="Potential", col="Preferred Foot", data=fifa19, col_w
```

Seaborn figure styles

- There are five preset seaborn themes: `darkgrid`, `whitegrid`, `dark`, `white` and `ticks`.
- They are each suited to different applications and personal preferences.
- The default theme is `darkgrid`.
- The grid helps the plot serve as a lookup table for quantitative information, and the white-on grey helps to keep the grid from competing with lines that represent data.
- The `whitegrid` theme is similar, but it is better suited to plots with heavy data elements:

I will define a simple function to plot some offset sine waves, which will help us see the different stylistic parameters as follows -

```
In [80]: def sinplot(flip=1):
          x = np.linspace(0, 14, 100)
```

```
for i in range(1, 7):  
    plt.plot(x, np.sin(x + i * .5) * (7 - i) * flip)
```

This is what the plot looks like with matplotlib default parameters.

In [81]: `sinplot()`

To switch to seaborn defaults, we need to call the `set()` function as follows -

In [83]: `sns.set()`
`sinplot()`

- We can set different styles as follows -

```
In [84]: sns.set_style("whitegrid")  
sinplot()
```

```
In [85]: sns.set_style("dark")  
sinplot()
```

```
In [86]: sns.set_style("white")  
sinplot()
```

```
In [87]: sns.set_style("ticks")  
sinplot()
```
